Planning (Project Plan)

Project Identification

Project Name:

E-Government Document Request System

Current Problem:

- 1- Long waiting times and crowded physical queues at government offices.
- 2- High risk of manual data entry errors and lost paper documents.
- 3- High administrative workload and printing/paper costs for government institutions.
- 4- Lack of transparency in tracking application status for citizens.

Description about project:

- The system is a web-based e-government platform designed to digitize and streamline official document request processes (e.g., birth certificates, national IDs, and official transcripts). It allows citizens to submit applications, upload verified credentials, and pay fees online, while enabling government staff to process, review, and issue digital or physical delivery requests efficiently.

System Request

E-Government Document Request System	
Project Sponsor:	Ministry of Telecommunication and Information Technology / Ministry of Interior
Business Need:	Eliminate physical queues and reduce overcrowding in -1 .administrative offices Digitulate document requests and enable 24/7 online access for -2 .citizens .Improve data security, storage, and processing efficiency -3
Business Requirements:	1- User authentication system with national ID verification. 2- Digital document request forms and file upload for supporting documents. 3- Secure online payment gateway integration for administrative fees. 4- Real-time application tracking dashboard for citizens and admin approval portal.
Business Value:	1- Reduces document processing time by up to 70%. 2- Cuts paper and administrative costs significantly. 3- Enhances citizen satisfaction and public service accessibility. 4- Minimizes corruption and human errors in record handling.
Special Issues or Constraints:	1- Strict compliance with national data privacy and cybersecurity regulations. 2- System integration with existing government national identity databases.

Feasibility Analysis

technical Feasibility

1. Frontend interfaces built using HTML5, CSS3, JavaScript, and Bootstrap framework.
2. Backend API development using ASP.NET / Node.js with Visual Studio / VS Code.
3. Secure web-based platform accessible via desktop and mobile internet browsers.
4. Database system (SQL Server / MySQL) to handle secure citizen records and requests.

Economic Feasibility

1. High cost savings achieved by eliminating physical paperwork, archiving, and manual verification.
2. Low long-term operational costs using scalable web technologies and open-source frameworks.
3. Increases revenue collection efficiency via automated online payment processing.
4. Reduces staffing and facility overhead in physical service centers.

organizational Feasibility

1. High cost savings achieved by eliminating physical paperwork, archiving, and manual verification.
2. Low long-term operational costs using scalable web technologies and open-source frameworks.
3. Increases revenue collection efficiency via automated online payment processing.
4. Reduces staffing and facility overhead in physical service centers.

Time Estimation

	Planning	Analysis	Design	Implementation
Standard percentages	15%	20%	35%	30%
Estimated time based on planning time	Actual: 11 days	16 days	25 days	22 days
